#### **DETAILED ACTION**

### **Specification**

1. Applicant has canceled claims 2, 22-29, and 35 without prejudice towards further prosecution. Claims 1, 3-8, 20, and 30-32 have been amended.

# Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1, 3-9, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997).

Tsien et al teach a method for sequencing a polynucleotide (Abstract), comprising the steps of :

(I) reacting a target polynucleotide with a polymerase enzyme and the different nucleotides, under conditions sufficient for the polymerase reaction (Abstract, Figures 1A, 1B and 2 and Example 3 and Claims 1-2); and

Art Unit: 1655

(ii) detecting an effect consequent on the incorporation of a specific nucleotide complementary to the target polynucleotide (Abstract, Claims 1, 7 and 12 and Example 4).

Tsien et al teach a method wherein the effect in step (ii) is detected by measuring radiation (Example 4).

Tsien et al teach a method wherein steps (I) and (ii) are conducted with each of the different nucleotides in turn, until incorporation is detected, and then repeated (Claims 49-50).

Tsien et al teach a method wherein step (I) is conducted with all the nucleotides present (Claim 4 and Figures 2 and 3).

Tsien et al teach a method wherein the nucleotides comprise a 3' blocking group which is removed after the polymerase reaction (Example 4 and Claims 3-5 and Figures 1-3).

Tsien et al teach a method wherein the blocking group can be selectively removed by pulsed monochromatic light (Page 25, lines 4-12).

Tsien et al teach a method wherein the nucleotide comprise a further blocking group at the terminal phosphate group of the triphosphate chain, and the further blocking group is removed prior to the removal of the 3' blocking group (Example 2).

Tsien et al inherently teach a method wherein the further blocking group can be selectively removed by pulsed monochromatic light under conditions and durations different from those required to remove the 3' blocking group (Page 25, lines 4-12).

Page 4

Application/Control Number: 09/463,549

Art Unit: 1655

Tsien et al inherently teach a method wherein the polynucleotide is DNA (Abstract and Figure 1).

Tsien et al do not teach a method wherein the polymerase enzyme is immobilized on a solid support.

Holzrichter et al. teach a method wherein the polymerase enzyme is immobilized on a solid support (Column 7, lines 22-28, abstract, Figure 2, and claims 1 and 11).

It would have been *prima facie* obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the polymerase enzyme immobilized on a solid support of Holzrichter et al. into the DNA sequencing method of Tsien et al, since Holzrichter et al. state, "The stationary mode of operation can be used to observe dynamic biological processes in real time and in a natural environment, such as polymerase processing of DNA for determining the sequence of a DNA molecule (Abstract, last sentence)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the polymerase enzyme immobilized on a solid support of Holzrichter et al. into the DNA sequencing method of Tsien et al. in order to improve the analysis of a plurality of target nucleic acid. An ordinary practitioner would have been motivated to combine and substitute the polymerase enzyme immobilized on a solid support of Holzrichter et al. into the DNA sequencing method of Tsien et al., in order to achieve the express advantages noted by Holzrichter et al., of a method that provides advantages of stationary mode of operation that can be used to observe dynamic

Art Unit: 1655

biological processes in real time and in a natural environment, such as polymerase processing of DNA for determining the sequence of a DNA molecule.

4. Claims 1, 3-9, 15, 17-18, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of Schwarz et al. (Trends in Biotechnology, (October ,1991), Vol. 9, pages 339-340).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Tsien et al in view of Holzrichter et al. do not teach detection of nucleic acid incorporation by surface plasmon resonance signal over time in the infra-red spectrum.

Schwarz et al. teach the detection of nucleic acid incorporation by surface plasmon resonance signal over time in the infra-red spectrum (Figure 2 and Page 340, Columns 1-3).

It would have been *prima facie* obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the detection of nucleic acid incorporation by surface plasmon resonance signal over time in the infra-red spectrum of Schwarz et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., since Schwarz et al. state, "The particular advantages of SPR-based biosensors are (1) rapid reading and (2) real-time kinetic analysis. Detection sensitivity approaches that of conventional methods, and simple protocols can be used because probe labeling is unnecessary. The operation of such biosensor is suitable for automation and can be developed to detect hybridizations of a sample to a number of

Page 6

Application/Control Number: 09/463,549

Art Unit: 1655

DNA probes simultaneously (Page 340, Column 2, last three sentences)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the detection of nucleic acid incorporation by surface plasmon resonance signal over time in the infra-red spectrum of Schwarz et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al. in order to improve the analysis of a plurality of target nucleic acid. An ordinary practitioner would have been motivated to combine and substitute the detection of nucleic acid incorporation by surface plasmon resonance signal over time in the infra-red spectrum of Schwarz et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., in order to achieve the express advantages noted by Schwarz et al., of a method that provides advantages of SPR-based biosensors (1) rapid reading and (2) real-time kinetic analysis where probe labeling is unnecessary and the operation of such biosensor is suitable for automation and can be developed to detect hybridizations of a sample to a number of DNA probes simultaneously.

5. Claims 1, 3-10, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of Chang et al. (U.S. Patent 5,801,042) (September 1, 1998).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Art Unit: 1655

Tsien et al in view of Holzrichter et al. do not teach the competitive inhibitor of the polymerase enzyme.

Chang et al. teach the competitive inhibitor of the polymerase enzyme (Column 24, lines 25-60).

It would have been prima facie obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the competitive inhibitor of the polymerase enzyme of Chang et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., since Chang et al. state, "These nucleoside analogs act as competitive inhibitors of DNA polymerase substrates. The analogous may act as a chain terminator, cause increased lability (e.g., susceptibility to breakage) of analogue-containing DNA, and/or impair the ability of the substituted DNA to act as template for transcription or replication (Column 24, lines 47-60)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the competitive inhibitor of the polymerase enzyme of Chang et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al. in order to inhibit the DNA polymerase to control and regulate the detection of the incorporated nucleotide. An ordinary practitioner would have been motivated to combine and substitute the competitive inhibitor of the polymerase enzyme of Chang et al. into the DNA sequencing method of Tsien et al. in view of Holzrichter et al., in order to achieve the express advantages noted by Chang et al., of a competitive inhibitor of DNA polymerase substrates that may act as a chain terminator, cause increased lability (e.g.,

Art Unit: 1655

susceptibility to breakage) of analogue-containing DNA, and/or impair the ability of the substituted DNA to act as template for transcription or replication.

6. Claims 1, 3-9, 11-12, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of O'Donnell (U.S. Patent 6,221,642 B1) (April 24, 2001).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Tsien et al in view of Holzrichter et al. do not teach the beta-2 dimer complex of the E.coli DNA polymerase III with the target polynucleotide.

O'Donnell. teach the beta-2 dimer complex of the E.coli DNA polymerase III with the target polynucleotide (Abstract, Figure 1 and Column 4, lines 26-61).

It would have been *prima facie* obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the beta-2 dimer complex of the E.coli DNA polymerase III with the target polynucleotide of O'Donnell into the DNA sequencing method of Tsien et al in view of Holzrichter et al., since O'Donnell states, "The beta clamp confers processivity onto the core polymerase by binding directly to the polymerase alpha subunit, thereby tethering the polymerase to DNA for processive syntheses (Column 4, lines 40-43)."

O'Donnell further states, "This high degree of symmetry in the beta ring could help promote smooth gliding along the symmetrical DNA duplex (Column 4, lines 61-63)". By employing

Art Unit: 1655

scientific reasoning, an ordinary artisan would have combined and substituted the beta-2 dimer complex of the E.coli DNA polymerase III with the target polynucleotide of O'Donnell into the DNA sequencing method of Tsien et al in view of Holzrichter et al., to improve the structure and function of the DNA polymerase. An ordinary practitioner would have been motivated to combine and substitute the beta-2 dimer complex of the E.coli DNA polymerase III with the target polynucleotide of O'Donnell into the DNA sequencing method of Tsien et al. in view of Holzrichter et al., in order to achieve the express advantages noted by O'Donnell, of the beta clamp that confers processivity onto the core polymerase by binding directly to the polymerase alpha subunit, thereby tethering the polymerase to DNA for processive syntheses and also to achieve the advantage of the high degree of symmetry in the beta ring that could help promote smooth gliding along the symmetrical DNA duplex.

7. Claims 1, 3-9, 13, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of Rosenthal et al. (PCT International Publication Number: WO 93/21340) (October 21, 1993).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Tsien et al in view of Holzrichter et al. do not teach the Taq polymerase.

Rosenthal et al. teach the Taq polymerase (Page 9, lines 5-10).

Art Unit: 1655

It would have been *prima facie* obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the Taq polymerase of Rosenthal et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., since Rosenthal et al state, "Suitable DNA polymerases are, for example, Sequenase 2.0, T4 DNA polymerase or the Klenow fragment of DNA polymerase 1 as well as heat-stable polymerase such as Taq polymerase (for example Taquenase) (Page 9, lines 7-10)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the Taq polymerase of Rosenthal et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., to improve the function of the DNA polymerase. An ordinary practitioner would have been motivated to combine and substitute the Taq polymerase of Rosenthal et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., in order to achieve the express advantages noted by Rosenthal et al., of suitable DNA polymerases for example, Sequenase 2.0, T4 DNA polymerase or the Klenow fragment of DNA polymerase 1 as well as heat-stable polymerase such as Taq polymerase (for example Taquenase).

8. Claims 1, 3-9, 14, 21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of Vind (U.S. Patent 6,159,687) (December 12, 2000).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Art Unit: 1655

Tsien et al in view of Holzrichter et al. do not teach the reverse transcriptase as the polymerase.

Vind teaches the reverse transcriptase as the polymerase (Column 7, lines 15-21).

It would have been prima facie obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the reverse transcriptase as the polymerase of Vind into the DNA sequencing method of Tsien et al, since Vind states, "The choice of polymerase is therefore an important means in controlling the average extension of the primers. These conditions may also exert an influence on the fidelity of the polymerase (the rate by which point mutations are introduced; HIV reverse transcriptase is an example of a polymerase of low fidelity), a parameter useful in combining shuffling and mutagenesis (Column 7, lines 15-21)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the reverse transcriptase as the polymerase of Vind into the DNA sequencing method of Tsien et al in view of Holzrichter et al., to improve the function of the DNA polymerase and the sequencing of DNA. An ordinary practitioner would have been motivated to combine and substitute the reverse transcriptase as the polymerase of Vind into the DNA sequencing method of Tsien et al in view of Holzrichter et al., in order to achieve the express advantages noted by Vind, of the choice of polymerase which is an important means in controlling the average extension of the primers which also may exert an influence on the fidelity of the polymerase (the rate by which point mutations are introduced; HIV reverse transcriptase is an example of a polymerase of low fidelity), a parameter useful in combining shuffling and mutagenesis.

Page 12

Application/Control Number: 09/463,549

Art Unit: 1655

9. Claims 1, 3-9, 16, 19-21 and 30-34 are rejected under 35 U.S.C. 103 (a) over Tsien et al. (PCT International Publication NO: WO 91/06678) (May 16, 1991) in view of Holzrichter et al. (U.S. Patent 5,620,854) (April 15, 1997) further in view of Smith et al. (U.S. Patent 5,753,439) (May 19, 1998).

Tsien et al in view of Holzrichter et al. teach the method of claims 1, 3-9, 21 and 30-34 as described above.

Tsien et al in view of Holzrichter et al. do not teach the detection of nucleotides by NMR using electromagnetic radiation.

Smith et al. teach the detection of nucleotides by NMR using electromagnetic radiation (Column 7, lines 14-29).

It would have been *prima facie* obvious to one having ordinary skill in the art at the time the invention was made to combine and substitute the detection of nucleotides by NMR using electromagnetic radiation of Smith et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al., since Smith et al. state, "These methods can be used to detect characteristic nucleic acid sequences, to determine target sequence and to screen for genetic defects and disorders. Assays can be conducted on solid surfaces allowing for multiple reactions to be conducted in parallel and, if desired, automated (Abstract, last two sentences)." By employing scientific reasoning, an ordinary artisan would have combined and substituted the detection of nucleotides by NMR using electromagnetic radiation of Smith et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al. to improve the sequencing of DNA. An

Art Unit: 1655

ordinary practitioner would have been motivated to combine and substitute the detection of nucleotides by NMR using electromagnetic radiation of Smith et al. into the DNA sequencing method of Tsien et al in view of Holzrichter et al. in order to achieve the express advantages noted by Smith et al., of the methods which can be used to detect characteristic nucleic acid sequences, to determine target sequence and to screen for genetic defects and disorders and which can be conducted on solid surfaces allowing for multiple reactions to be conducted in parallel and, if desired, automated.

### Response to Amendment

10. In response to amendment, 112 (first paragraph) rejection and 102 (b) rejections have been withdrawn. However, new 103 (a) rejections have been included.

## Response to Arguments

11. Applicant's arguments with respect to all pending claims have been considered but are most in view of the new ground(s) of rejection.

Art Unit: 1655

#### Conclusion

12. Applicant's submission of an information disclosure statement under 37 CAR 1.97<sup>©</sup> with the fee set forth in 37 CAR 1.17(p) on January 16, 2002 prompted the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 609(B)(2)(I). Applicant is reminded of the extension of time policy as set forth in 37 CAR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CAR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Arun Chakrabarti, Ph.D., whose telephone number is (703) 306-5818. The examiner can normally be reached on 7:00 AM-4:30 PM from Monday to Friday.

Art Unit: 1655

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Jones, can be reached on (703) 308-1152. The fax phone number for this Group is (703) 305-7401.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 308-0196.
